# 2021 Week 1 | Power BI: Connecting To & Modeling Data

6 Comments / [Power BI](#), [Workout Wednesday](#) / By [Spencer Baucke](#)

## Introduction

Hey all! Thank you so much for checking out the new Power BI edition of #WorkoutWednesday. Although the Tableau version of #WorkoutWednesday has been going on for several years, this is our first attempt at creating a similar community with Power BI. If you're unfamiliar with the concept, we will release a challenge every week on Tuesday evening. The challenge will consist of a data set, a set of requirements, and eventually a solution video. The hope is that you will take the data set and fulfill all of the requirements in the blog post (such as you're reading now). The goal is to highlight new techniques, common workarounds, and to generally expand your skillset. No need to delay any further, let's hop right into it!

## Requirements

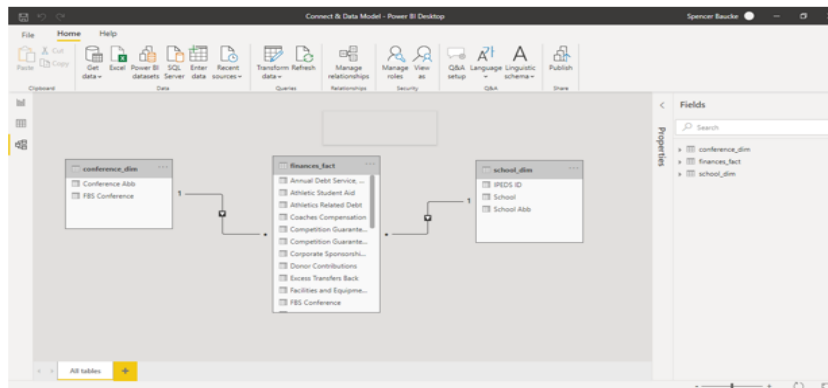

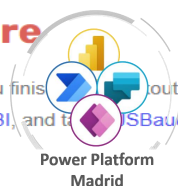

- Because this is the first ever #WorkoutWednesday Power BI style, we are going to start simple. The first few challenges are going to build on one another, so keep this in mind as we start out the year.
- Create cleaned data set with only **teams** from the Football Bowl Division. In order to do this, in the FBS Conferences field exclude the FBA Totals and null values.
- Within NCAA Subdivision, remove all Conference Medians
- Create data model properly relating two dim tables to the fact table.
- Try and use as least amount of steps as possible.

## Dataset

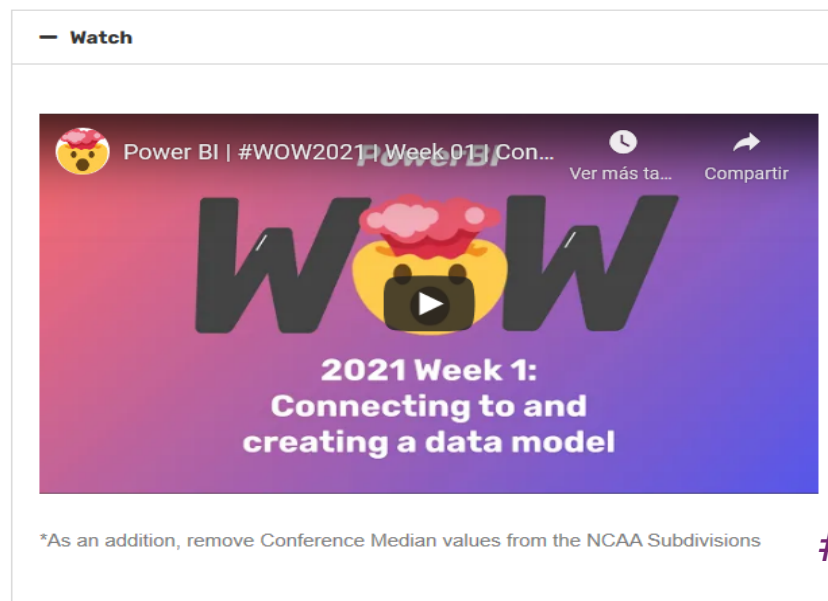

This week uses a data set that breaks down NCAA athletic department expenses and revenues by year. You can get it here at [data.world](#)

## Share

After you finish, share on Twitter using the hashtags [#WOW2021](#) and [#PowerBI](#), and tag [@Sbaucke](#), [@MMarie](#), [@shan\\_gsd](#) and [@dataveld](#)

## Solution

\*As an addition, remove Conference Median values from the NCAA Subdivisions

#WOW2020

**Débora Contente**

10 May

For [#WOW2020](#) I couldn't resist building the same scenario with bars and changing the colour palette.

Thanks for the challenge
